Tests for Intelligence

- Turing test
- 'IQ' tests
- Problem solving tests
- Car driving skills
- ...

But dogs, monkeys and dolphins fail them.

Focusing on human-like performance is
limiting.

Intelligence - Definition

Intelligence: The degree of flexibility in both learning and behaviour [1].

Intelligence - Overview

Might not be best at specific task.

But can do a lot of different tasks quite well.

→ General solution.

The Human Brain in Numbers

Neurons in brain (total)	86 billion (100%)
Neurons in cerebellum	69 billion (80%)
Rel. size of cerebellum	10% of brain
Neurons in cerebral cortex	16 billion (19%)
Rel. size of cerebral cortex	82% of brain
Neurons in brain stem	1 billion (1%)

Data from [2].

The Human Brain

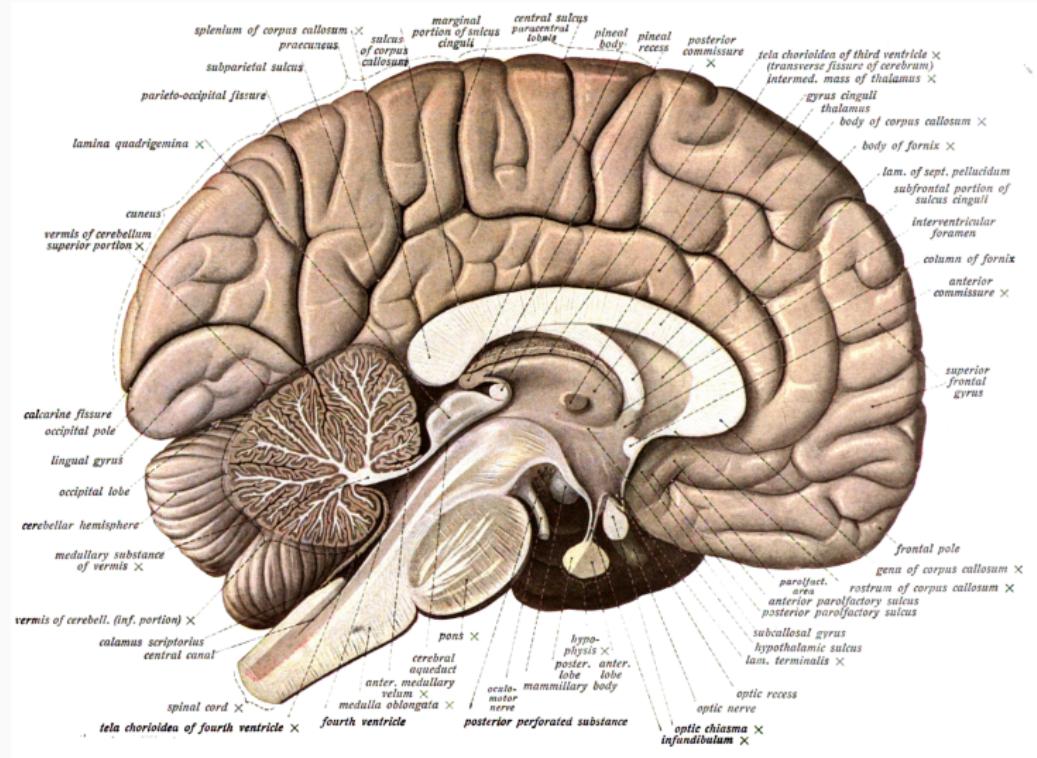

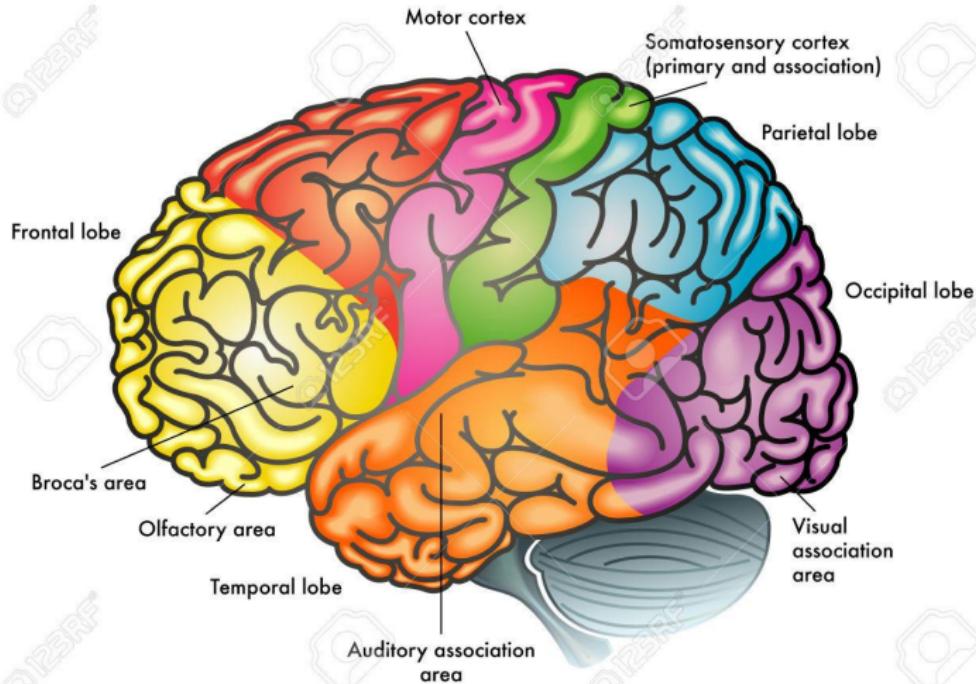

Image from [3].

The Human Brain - Different Areas

Cortical Column

“There is nothing visual about the visual cortex, and nothing auditory about the auditory cortex”

- Vernon Mountcastle

Cortical Column

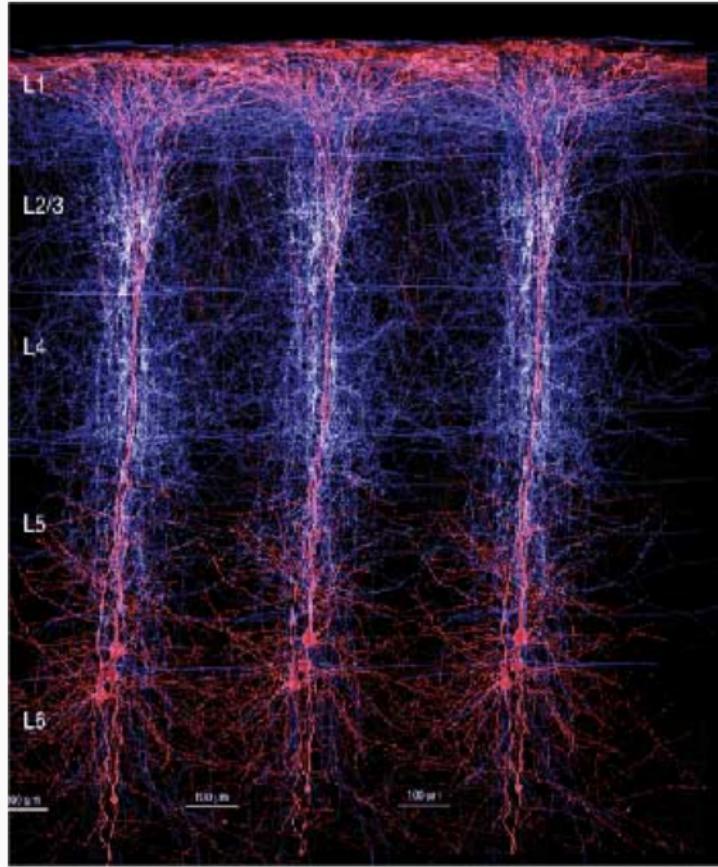

Image from [4].

Cortical Column

- Everywhere in the Brain
- 80-120 up to 200-400 Neurons
- Smallest symbol unit
- Activity has meaning

Neuron - Number of Connections

Min. n. of connections	1'000
Avg. n. of connections	7'000
Max. n. of connections	10'000
Firing Rate	20-250 Hz (453 Hz [5])

Connection data from [2] and firing rate from [6].

Neuron - Spike Frequencies

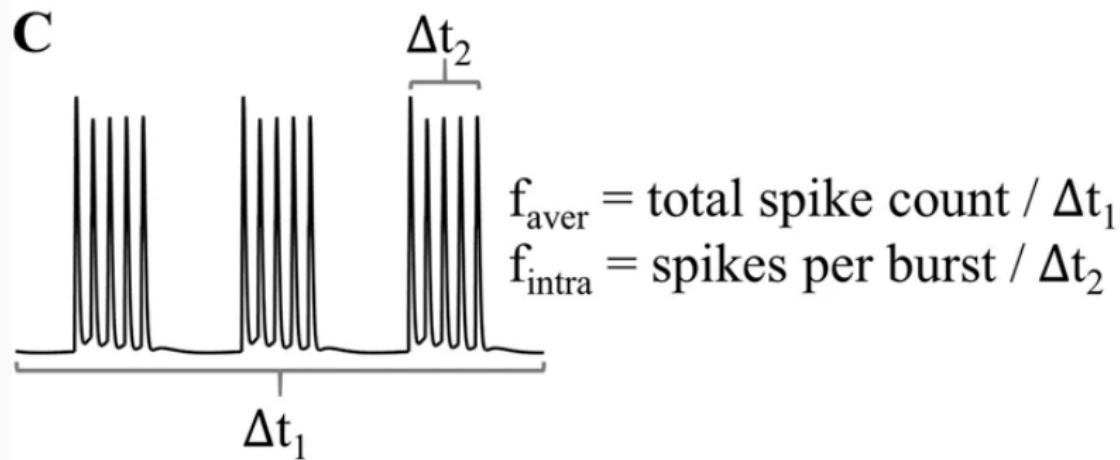

Image adapted from [7].

Neuron - Overview

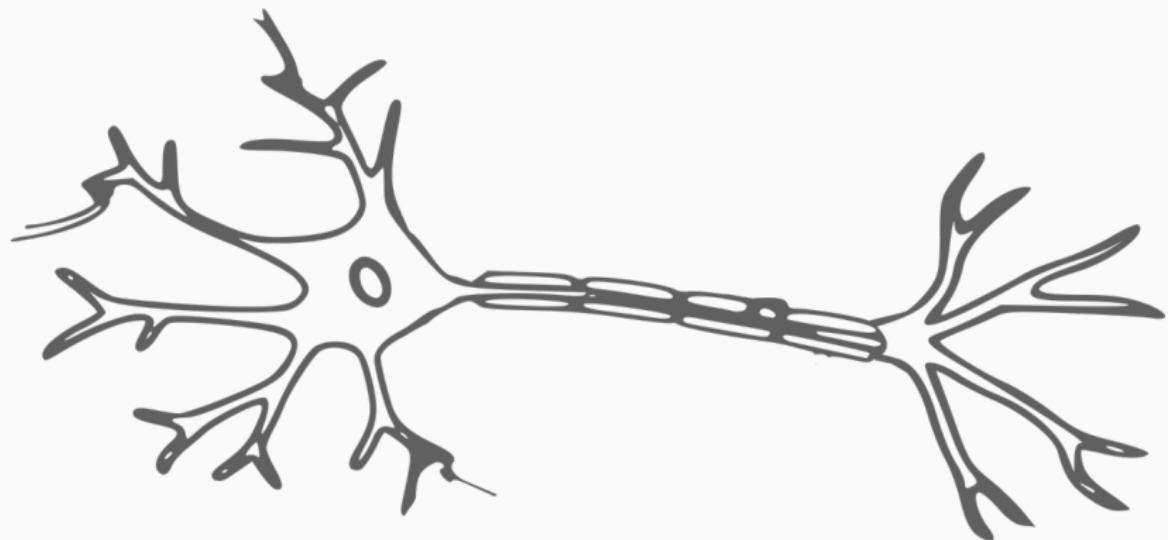

Image from [8].

What is HTM?

- Biologically constrained **Theory of Intelligence**
 - First described in "On Intelligence"
 - **Based on Neuroscience** of the brain
- Learning Algorithms (of the brain)

Not Included in HTM

- Firing rythms
- Emotions
- Basic Behaviours
- Sleep (yet)

The brain as Prediction Machine

- Prediction of future sensory input
- 'Anticipating' events
- multiple connected regions
- Invariant representations
- Hierarchies of Concepts
- A sense of location

Attributes of HTM Algorithms

- can store, learn, infer and recall higher-order sequences
- learns unsupervised time-based patterns in unlabeled data on continuous streams
- robust against noise
- can learn multiple patterns at once
- suited for prediction, anomaly detection, classification
- tested and implemented in software
- commercially used (anomaly detection, NLP)

The role of Time

Crucial for learning, inference and prediction.

- Inference is hard on static information
- Predictions are somewhat inherently time-based
- Learning is hard without feedback

Why Hierarchy?

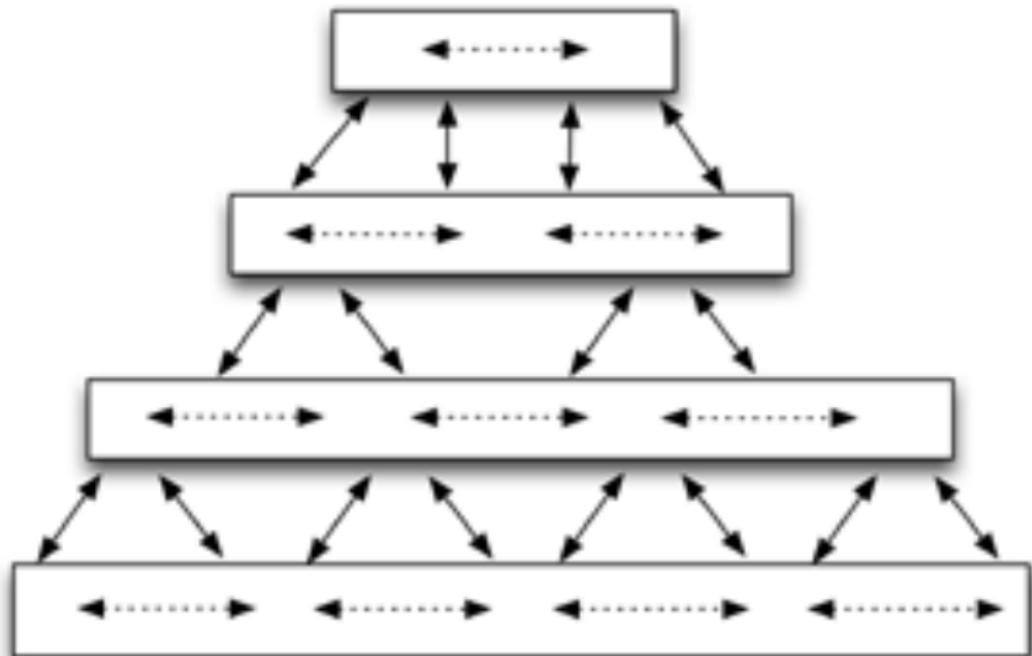

If there is a connection cost, hierarchies are more efficient [9].

Especially when tasks change regularly.

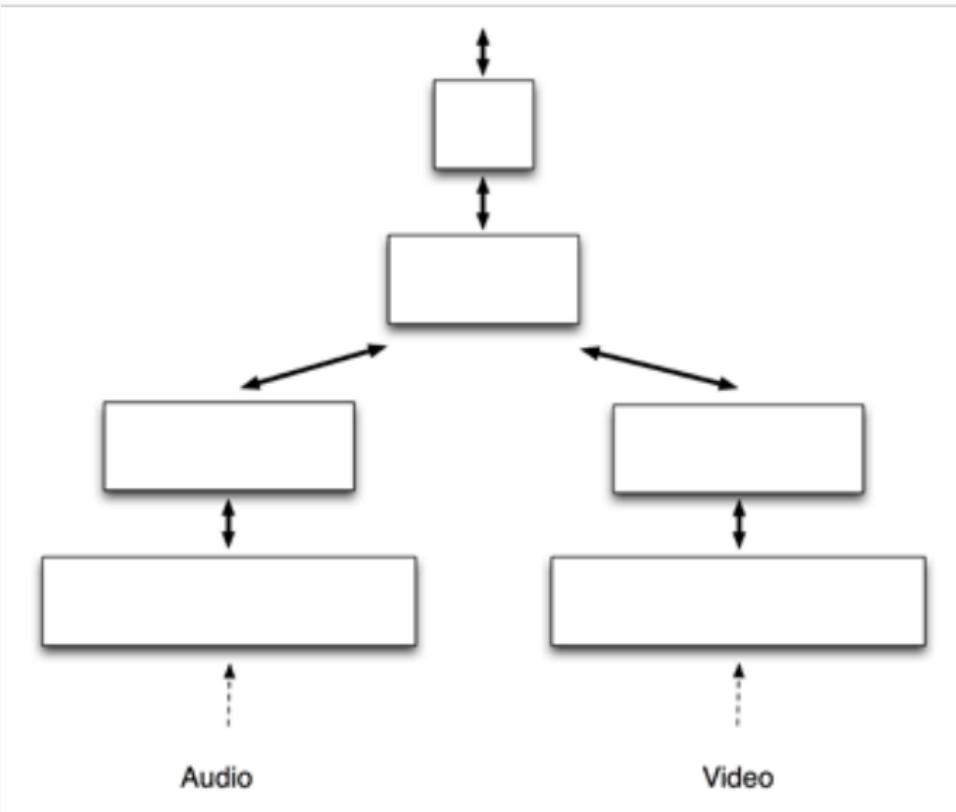

Why Hierarchy? II

- Reduced Training Time
- Reduced Memory Usage
- Introduce Generalizations
- Learned patterns are recombined at higher levels
- Transfer Learning

What Hierarchy

Example Application

How Many Levels?

- They always learn the best representation
- Tradeoff between depth and layer size
- Simple problems can be solved with one region

Region - Introduction

Region - Details

Region - Attributes

- All Regions do basically the same
- Based on Biological Regions in the Brain
- HTM Regions are similar to Layer 3 of the Neocortex
- Can do Inference and Prediction even on complex data

What is 01100101? Could be either one of:

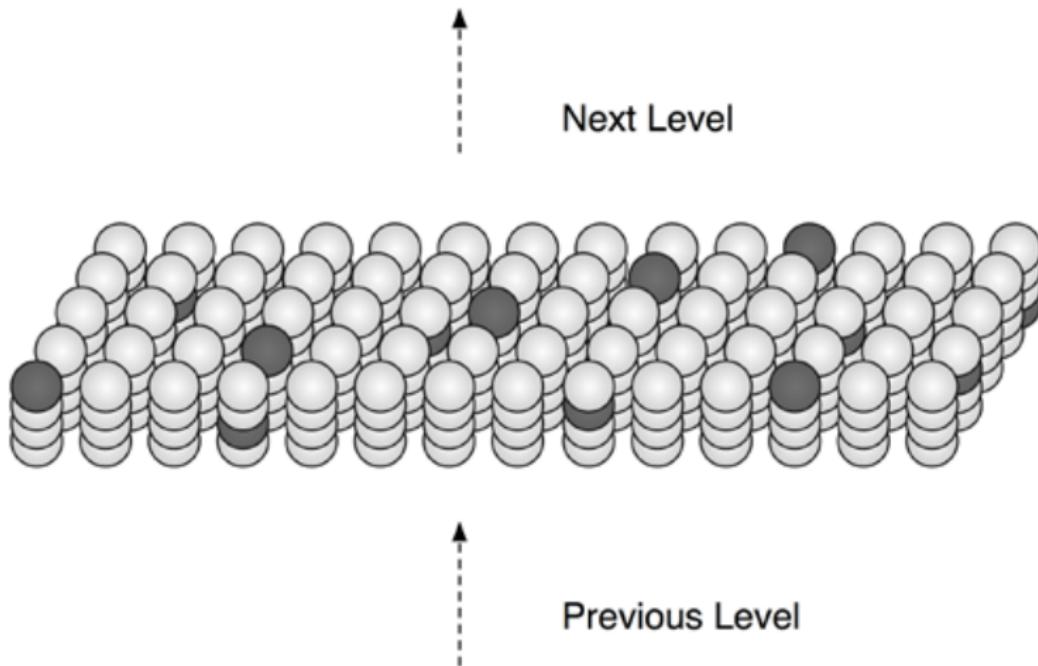

- Booleans
(False, True, True, False,...)
- Integer (101)
- Float (3328.0)
- (Byte-) String ('e')
- Pointer to something else
- Part of some other Datastructure

**Biological observation:
We use only part of our brain!**

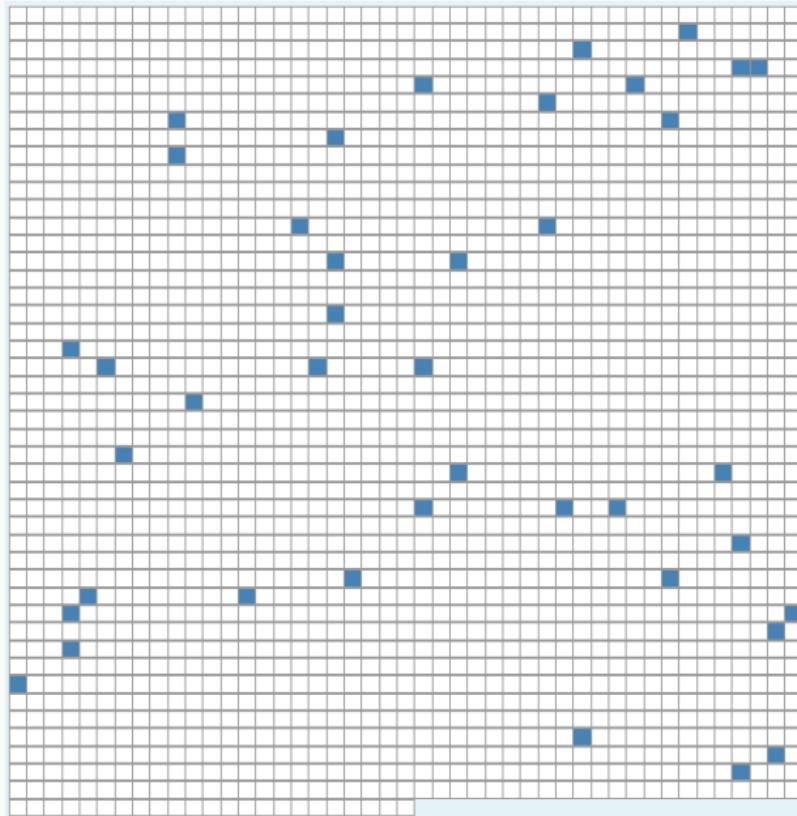

Sparse Distributed Representation - Introduction

- Datastructure of the brain
- Sparse (around 2% are active)
- Distributed (clusters are somewhat rare)
- Inhibitory mechanisms
- Neuron states actually have 'meaning'
- Combined, they give context as well
- Many mechanisms in the brain would not work otherwise

Sparse Distributed Representation - Example

Sparse Distributed Representation - Example

Live Demo!

Sparse Distributed Representation - Live Demos

- Ep2/Capacity
- Ep2/Matching (Noise resistency)
- Ep3/Subsampling
- Ep4/Classification
- Ep4/Union
- Ep5/Scalar Encoding
- Ep6/Date Encoding
- Ep5/RDSE - Number Encoding

Encoders - Conclusion

- Semantically similar data should result in SDRs with overlapping active bits.
- The same input should always produce the same SDR as output.
- The output should have the same dimensionality (total number of bits) for all inputs.
- The output should have similar sparsity for all inputs and have enough one-bits to handle noise and subsampling.

Spatial Pooler

Temporal Pooler

HTM Recap

Implications

Sources

Learning

- Learning is purely statistical
- Looking for Spatial and Temporal Patterns
- Regions themselves are limited
- Automatically adjusts to size of allocated Memory
- Automatic On-Line learning
- Takes longer to learn high-level concepts with lower levels missing
- Only a precursor for inference and prediction

Inference

- Matching previously learned sequences
- Example: recognizing a melody
- There are only novel experiences
- Partial SDR matches suffice

Prediction

- Matching stored sequences
- Can be thought of to be similar to a markov chain
- Takes up a considerable amount of memory
- Integral to how the brain works

Prediction - Key Properties

- Continuity
- Occurs everywhere
- Context sensitivity
- Stability
- Anomaly Detection
- Noise robustness

Temporal Memory - Advanced

- Within a region
- But also across
- Up and Down
- There are much more connections
DOWN than UP
- In fact, about 90% go either sideways or
DOWN

Temporal Memory - Example II

- I **ate** a pear
 - I have **eight** pears
-
- I ...
 - I have ...

Temporal predictions add to the threshold for the spatial pooler!

Q: If you have an SDR with 10 000 Cells and 200 active, how much difference would saving only 20 of them make?

A: Due to the property of SDRs, it is *very* unlikely that they activate in a totally unrelated pattern.

Temporal Pooler - Closing notes

- Every Column will have a winner cell
- Bursting can happen on single columns as well

Representation

Learning

Overview

Spatial Pooler

Temporal Pooler

HTM Recap

Implications

Sources

- The Neocortex is only a part of the brain
- The smallest computational units are called 'Cortical Columns'
- Every Neuron has on average 7'000 Connections

HTM Theory

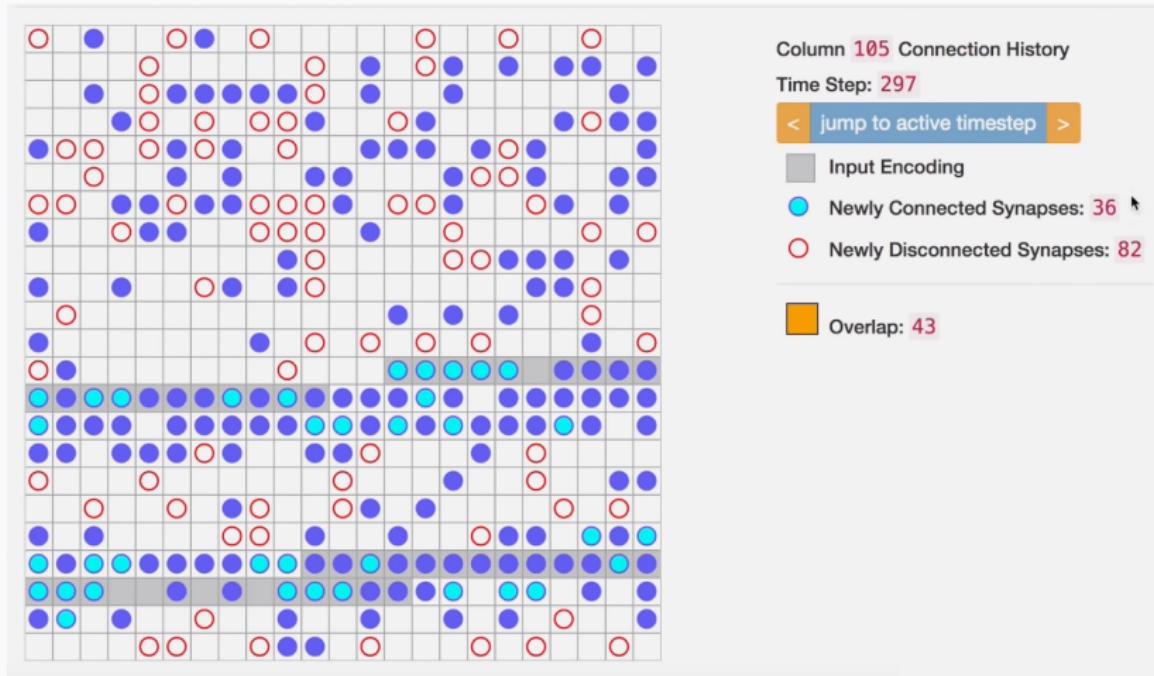

- Biologically constrained, based on Neuroscience
- Everything is predicting everything
- Closest to how the brain really works
- Time is important

Sparse Distributed Representation

- Data structure of the Brain
- Sparse (very few ON-bits)
- Distributed
- Required for other mechanisms
- Encoders are important!

- Only statistical
- Based on Prediction and Inference
- Spatial and Temporal patterns
- Context sensitive
- Trying to minimize Errors (Bursting)

Spatial Pooler

Spatial Pooler

- Calculate Overlap Scores (+Boosting)
- Inhibit
- Update connection values

Temporal Pooler

- Form representations in context of previous states
- Form predictions based on previous inputs
- Context dependent
- Can modulate spatial pooler results
- One cell can represent many different concepts!

Implications

Sources

Implications - Models

Your brain is creating predictive models for everything.

You are only familiar with what you have already thought about.

Learning is the active creation of new models (spatial and temporal patterns).

Implications - Learning

While Learning, you need about 90 percent more capacity than after having mastered something.

'AHA-Moment' is when models line up, and bursting ceases.

Smarter people have clearer models and have less overall brain activity (higher efficiency). ^{105/124}

Implications - Brain Parameters

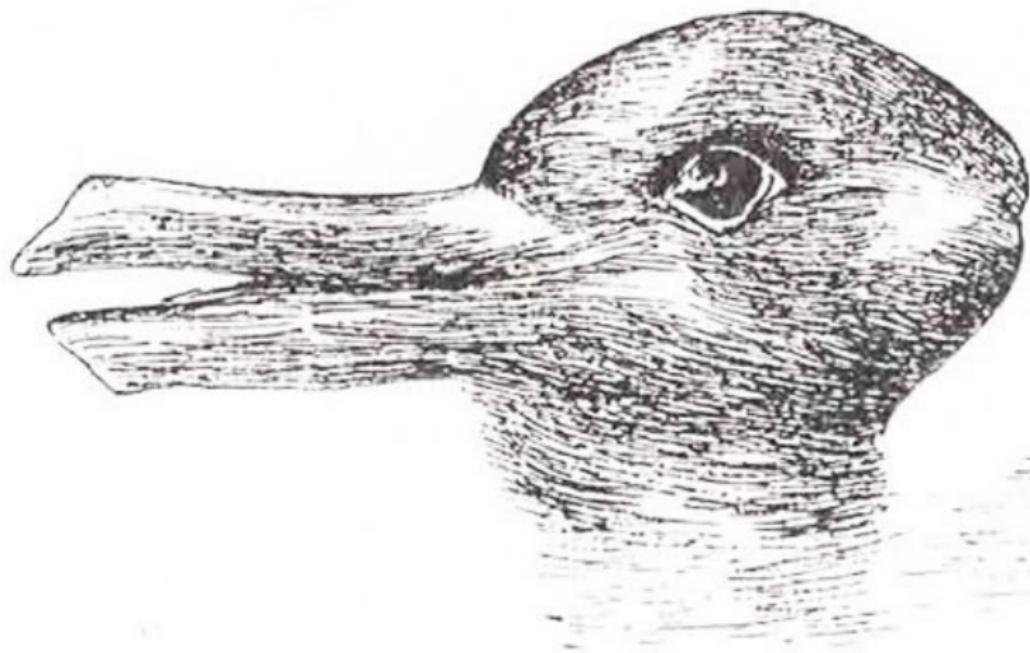

There is also a varying threshold for the spatial pooler activations.

This probably also changes during sleep.

Implications - Conformation Bias

Conformation Bias is a predictable result from the temporal pooler.

Implications - Inhibition in the Visual System

Implications - Inhibition in the Visual System

Implications - Top-Down Processing I

Yuo cna porbalby raed tihs esaliy desptie teh
msispeillgns.

A vheclie epxledod at a plocie cehckipont
near the UN haduqertares in Bagahdd on
Mnoday kilinlg the bmober and an Irgai
polcie offceir

Implications - Top-Down Processing II

Aoccdrnig to a rscheearch at Cmabrigde Uinervtisy, it deosn't mttaer in waht oredr the ltteers in a wrod are, the olny iprmoetnt tihng is taht the frist and lsat ltteer be at the rghit pclae. The rset can be a toatl mses and you can sitll raed it wouthit porbelm. Tihs is bcuseae the huamn mnid deos not raed ervey lteter by istlef, but the wrod as a wlohe.

Implications - Bottom-Up-Gradient

There is a parameter for how much predictive states count for the spatial pooler.

Which one would be better?

Possibility: Predictive states count less for Autistic people.

Implications - Hallucinating

Hallucinating is just active boosting in the human brain.

Concentration going awry as well ...

Phantom limbs ...

Implications - Reticular Activating System

Ever noticed after buying something,
everyone has the same thing?

Implications - Priming Bias

Priming really leaves some predictive states, even though it never gets high enough in the hierarchy to notice it consciously.

Implications - Cached Thought

This fully explains the fallacy of cached thought, among others.

Implications - Meaning

Something has meaning if it is a well-connected concept.
